1 Safety instructions, legal requirements, warranty, return policy

1.1 Symbols used in these operating instructions

Danger
This symbol represents an immediate hazardous situation which could result in **serious injury, death** or **damage to the equipment**. Where this symbol is shown, do not use the equipment further unless you have fully understood the nature of the hazard and have taken the required precautions.

!

Attention
This symbol indicates important instructions which should be respected in order to avoid damaging or destroying the equipment. Follow the the precautions given in these instructions to avoid the hazard. Call our service team if necessary.

Call service
Where this symbol is shown call our service team for advice if necessary.

Note
This symbol indicates a note or detailed set-up tip.

- Information point.

<ESC> Operator keys are printed in bold typeface and placed in pointed brackets.

1.2 Safety instructions

- Do not install, operate or maintain this flowmeter without reading, understanding and following these operating instructions, otherwise injury or damage may result.
- Study these operating instructions carefully before the installation of the equipment and keep them for future reference.
- Observe all warnings, notes and instructions as marked on the packaging, on the equipment, and detailed in the operating instructions.
- Do not use the instrument under wet conditions with the battery cover removed or opened.
- Follow the unpacking, storage and preservation instructions to avoid damage to the equipment.
- Install the equipment and cabling securely and safely according to the relevant regulations.
- If the product does not operate normally, please refer to the service and troubleshooting instructions, or contact KATRONIC for help.

1.3 Warranty

- Any product purchased from KATRONIC is warranted in accordance with the relevant product documentation and as specified in the sales contract provided it has been used for the purpose for which it has been designed and operated as outlined in these operating instructions. Misuse of the equipment will immediately revoke any warranty given or implied.
- Responsibility for suitability and intended use of this ultrasonic flowmeter rests solely with the user. Improper installation and operation of the flowmeter may lead to a loss of warranty.
- Please note that there are no operator-serviceable parts inside the equipment. Any unauthorised interference with the product will invalidate the warranty.

1.4 Return policy

If the flowmeter has been diagnosed to be faulty, it can be returned to KATRONIC for repair using the Customer Returns Note (CRN) attached to the Appendix of this manual. KATRONIC regret that for Health & Safety reasons we cannot accept the return of the equipment unless accompanied by the completed CRN.

1.5 Legislative requirements

CE marking

The flowmeter is designed to meet the safety requirements in accordance with sound engineering practice. It has been tested and has left the factory in a condition in which it is safe to operate. The equipment is in conformity with the statutory requirements of the EC directive and complies with applicable regulations and standards for electrical safety EN 61010 and electro-magnetic compatibility EN 61326. A CE Declaration of Conformity has been issued in that respect, a copy of which can be found in the Appendix of these operating instructions.

WEEE Directive

The Waste Electrical and Electronic Equipment Directive (WEEE Directive) aims to minimise the impact of electrical and electronic goods on the environment by increasing re-use and recycling and by reducing the amount of WEEE going to landfill. It seeks to achieve this by making producers responsible for financing the collection, treatment, and recovery of waste electrical equipment, and by obliging distributors to allow consumers to return their waste equipment free of charge.

KATRONIC offers its customers the possibility of returning unused and obsolete equipment for correct disposal and recycling. The Dustbin Symbol indicates that when the last user wishes to discard this product, it must be sent to appropriate facilities for recovery and recycling. By not discarding this product along with other household-type waste, the volume of waste sent to incinerators or landfills will be reduced and natural resources will be conserved. Please use the Customer Return Note (CRN) in the Appendix for return to KATRONIC.

RoHS Directive

All products manufactured by KATRONIC are compliant with the relevant aspects of the RoHS Directive.

2 Introduction

Clamp-on transit-time flowmeter

The KATflow 200 is a hand-held, battery operated ultrasonic flowmeter employing clamp-on sensors for the measurement of liquids in full, enclosed pipes. Flow measurements can be undertaken without interruption of the process or interference with the integrity of the pipeline. The clamp-on sensors are attached to the outside of the pipes. The KATflow 200 uses ultrasonic signals for measurement of the flow, employing the transit-time method.

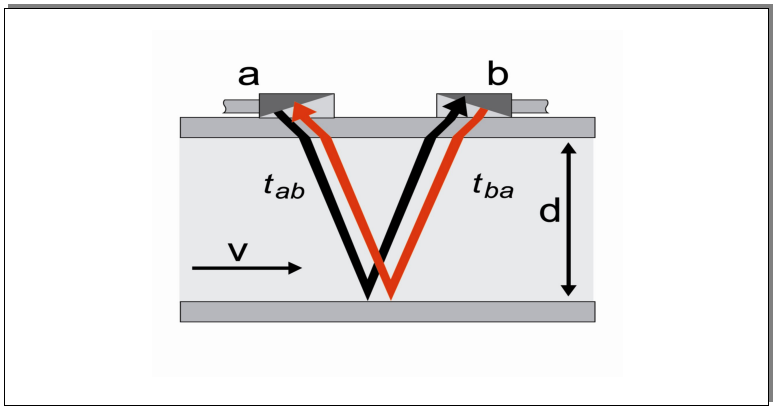

Illustration 1: Clamp-on ultrasonic flowmeter configuration

Measuring principle

Ultrasonic signals are emitted by a transducer installed on a pipe and received by a second transducer. These signals are emitted alternately in the direction of flow and against it. Because the medium is flowing, the transit time of the sound signals propagating in the direction of flow is shorter than the transit time of the signal propagating against the direction of flow. The transit-time difference ΔT is measured and allows the determination of the average flow velocity along the path of acoustic propagation. A profile correction is then performed to obtain the average flow velocity over the cross-sectional area of the pipe, which is proportional to the volumetric flow rate.

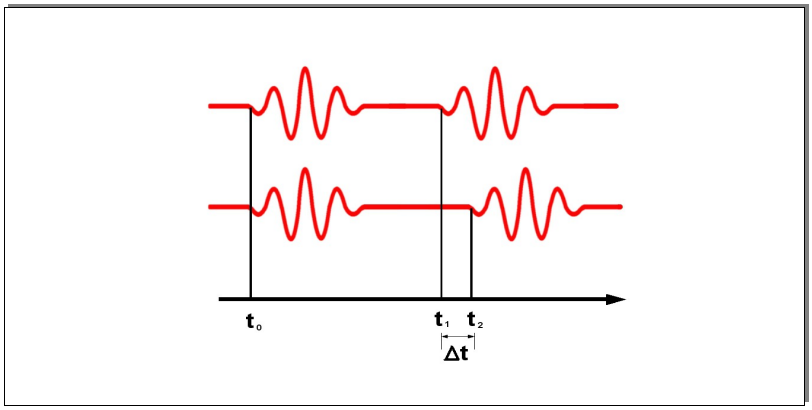

Illustration 2: Transit-time measuring principle

3 Installation

3.1 Unpacking and storage

3.1.1 Unpacking

Care should be taken when opening the box containing the flowmeter, any markings or warnings shown on the packaging should be observed prior to opening. The following steps should then be taken:

- Unpack the flowmeter in a dry area.
- The flowmeter should be handled with care and not left in an area where it could be subject to physical shocks.
- If using a knife to remove packaging care should be taken not to damage the flowmeter or cables.
- The flowmeter package and contents should be checked against the delivery note supplied and any missing items reported immediately.
- The flowmeter package and contents should be checked for signs of damage during transport and any problems reported immediately.
- The vendor accepts no responsibility for damage or injury caused during the unpacking of the instrumentation supplied.
- Excess packing materials should be either recycled or disposed of in a suitable way.

3.1.2 Storage

If storage is necessary, the flowmeter and sensors should be stored:

- in a secure location,
- away from water and harsh environmental conditions,
- in such a way as to avoid damage,
- small items should be kept together in the bags and small plastic boxes provided to avoid loss.

3.1.3 Identification of components

The following items are typically supplied (please refer to your delivery note for a detailed description):

- KATflow 200 hand-held flowmeter
- Clamp-on sensors (usually one or two pairs depending on pipe sizes to be measured)
- Sensor extension cable(s) (optional)
- Sensor mounting accessories
- Coupling component
- Measuring tape
- Operating instructions
- Calibration certificate(s) (optional)

3.2 Clamp-on sensor installation

The correct selection of the sensor location is crucial for achieving reliable measurements and high accuracy. Measurement must take place on a pipe in which sound can propagate (see Acoustic propagation) and in which a rotationally symmetrical flow profile is fully developed (see Straight pipe lengths).

The correct positioning of the transducers is an essential condition for error-free measurements. It ensures that the sound signal will be received under optimal conditions and evaluated correctly. Because of the variety of applications and the different factors influencing the measurement, there can be no standard solution for the positioning of the transducers.

The correct position of the transducers will be influenced by the following factors:

- diameter, material, lining, wall thickness and general condition of the pipe,
- the medium flowing in the pipe,
- the presence of gas bubbles and solid particles in the medium.

Check that the temperature at the selected location is within the operating temperature range of the transducers (see technical specification in the Appendix).

Acoustic propagation Acoustic propagation is achieved when the flowmeter is able to receive sufficient signal from the transmitted ultrasonic pulses. The signals are attenuated in the pipe material, the medium and at each of the interfaces and reflections. External and internal pipe corrosion, solid particles and gas content in the medium contribute heavily to signal attenuation.

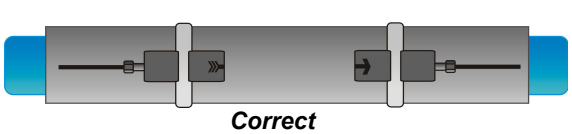
Straight pipe lengths Sufficient straight lengths of pipe on the inlet and outlet of the measuring location ensure an axi-symmetrical flow profile in the pipe, which is required for good measurement accuracy. If insufficient straight lengths of pipe are available for your application measurements are still obtainable, but the certainty of the measurement can be reduced.

3.3 Installation location

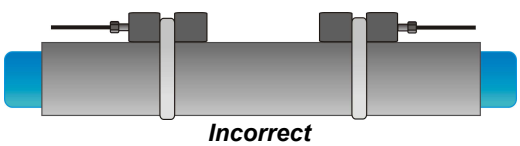
Select an installation location following the recommendations in Table 1 and try to avoid measuring :

- in the vicinity of deformations and defects of the pipe,
- near welding seams,
- where deposits could be building up in the pipe.

For a horizontal pipe:
Select a location where the transducers can be mounted on the side of the pipe, so that the sound waves emitted by the transducers propagate horizontally in the pipe. In this way, the solid particles deposited on the bottom of the pipe and the gas pockets developing at the top will not influence the propagation of the signal.



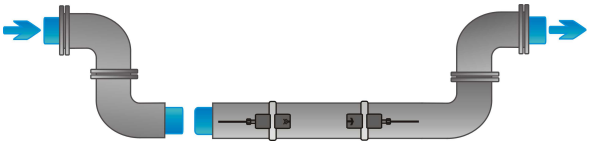
Correct



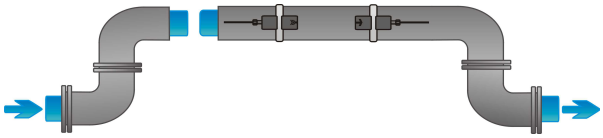
Incorrect

For a free inlet or outlet pipe section:
Select the measuring point at a location where the pipe cannot run empty.

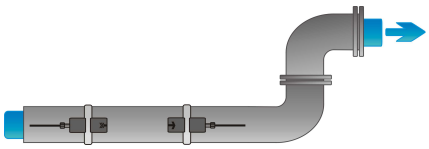
Correct



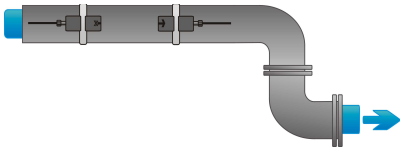
Disadvantageous



Correct



Disadvantageous



For a vertical pipe:
Select the measuring point at a location where the liquid flows upward to ensure that the pipe is completely filled.

Correct

Incorrect

Table 1: Recommendations for sensor mounting location

Look for a sensor installation location with sufficient straight pipe to obtain accurate measurements. Please refer to Table 2 as a guideline for recommended distances from disturbance sources.

3.4 Pipe preparation

- Clean dirt and dust from around the area of the pipework where the sensors are to be placed.
- Remove loose paint and rust with a wire brush or file.

Firmly bonded paint does not necessarily need to be removed provided the flowmeter diagnostics indicate sufficient signal strength.

3.5 Clamp-on sensor mounting configurations and separation distance

Reflection Mode

The most common clamp-on sensor mounting configuration is the Reflection Mode, sometimes known as V-Mode (see Illustration 3, sketch (1). Here, the ultrasonic signal passes twice through the medium (2 signal passes). The Reflection Mode is the most convenient mounting method as the transducer separation distance can be measured easily and the sensors can be accurately aligned. This method should be used whenever possible.

Diagonal Mode

An alternative mounting configuration (Illustration 3, sketch (3)) is the Diagonal mode (Z-Mode). The signals travel only once through the pipe. This method is often used for larger pipes where greater signal attenuation might occur.

Further variation of the Reflection and the Diagonal Modes are possible by altering the number of passes through the pipe. Any even number of passes will require mounting the sensors on the same side of the pipe, while with an odd number of passes, the sensors must be mounted on opposite sides of the pipe. Commonly, for very small pipes, sensor mounting configurations such as 4 passes (W-mode) or 3 passes (N-mode) are used (Illustration 3, sketch (2)).

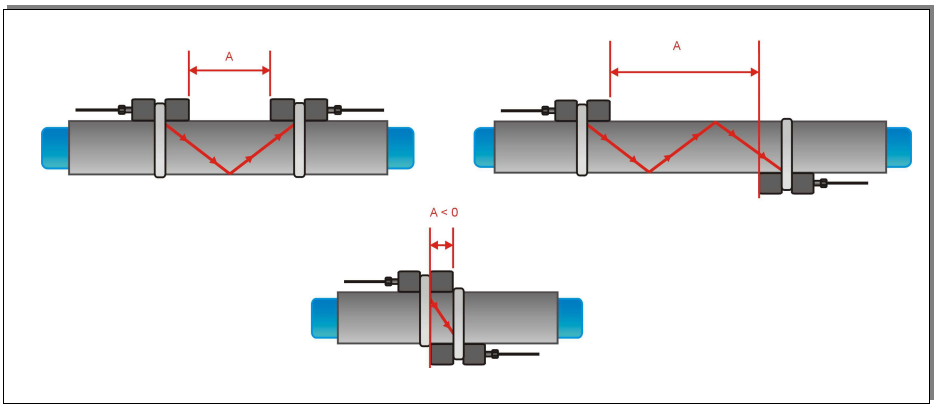

Illustration 3: Clamp-on sensor mounting configurations and sensor spacing

Transducer separation distance

The transducer separation distance A is measured from the inside edges of the sensor heads as shown in illustration 3. It is automatically calculated by the flowmeter based on the parameter entries for pipe outside diameter, wall thickness, lining material and thickness, medium, process temperature, the sensor type and the selected number of signal passes.

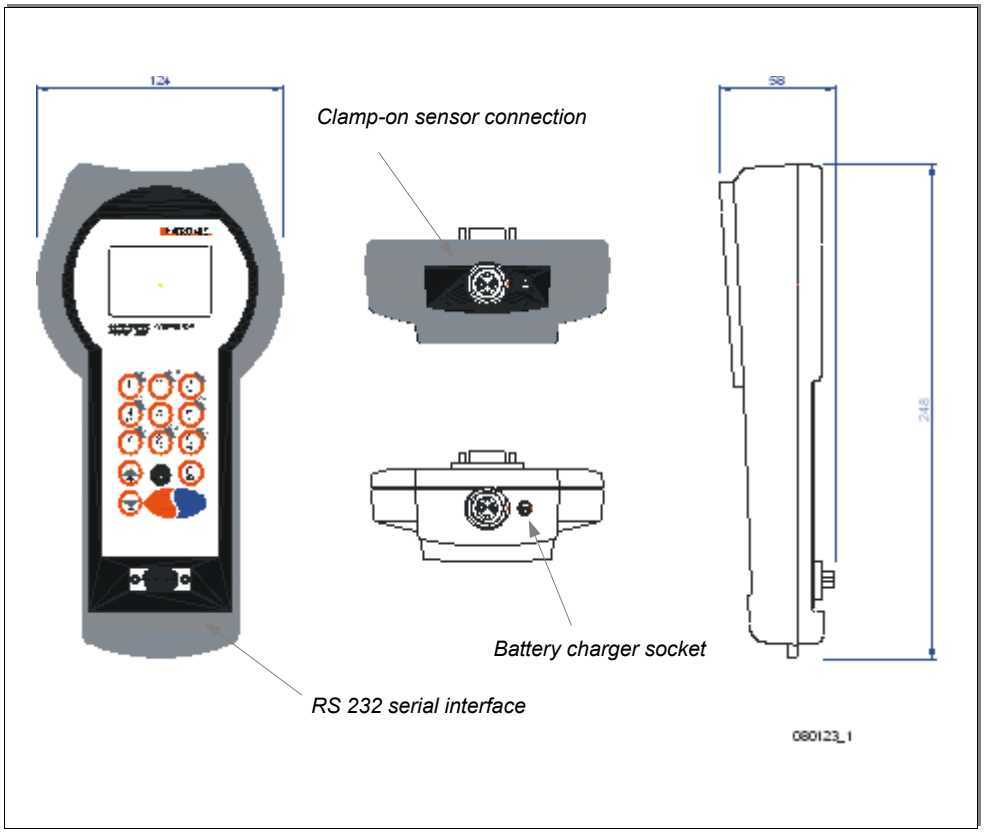
A negative separation distance A < 0 can occur for mounting configurations on small pipes where diagonal mode operation has been selected (see Illustration 3, sketch (3). Negative separation distances may be suggested for reflection mode installations, but are not possible. In these cases, use diagonal mode or a larger number of passes.

3.6 Flowmeter installation

3.6.1 Outline dimensions

The KATflow 200 is a hand-held, battery operated device with the following outline dimensions.

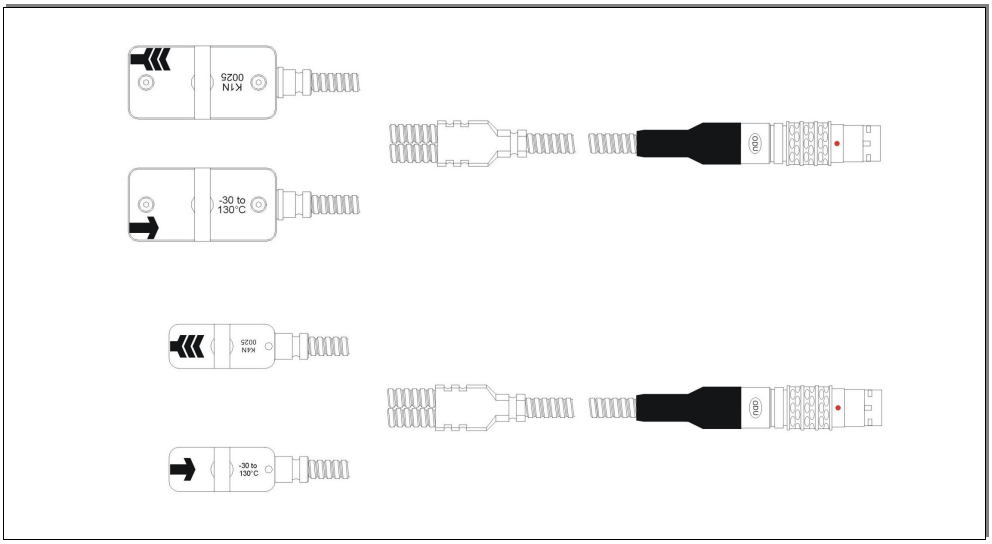
Flowmeter outline dimensions



Drawing 1: Outline dimensions KATflow 200

K1 type transducer

K4 type transducer



Drawing 2: Transducers

3.6.2 Electrical connections

Drawing 3: Electrical connection diagram

3.7 Clamp-on sensor mounting

Before the sensors can be mounted

- the installation location should have been determined,
- a sensor mounting method should be chosen,
- the flowmeter batteries must be sufficiently charged,
- the sensors must be connected to the transmitter.

Depending on which sensor mounting method is being used, the clamp on sensors are either mounted on the same side of the pipe (Reflection Mode) or on opposite sides of the pipe (Diagonal Mode – See Section 2.5).

3.7.1 Sensor pipe mounting configurations

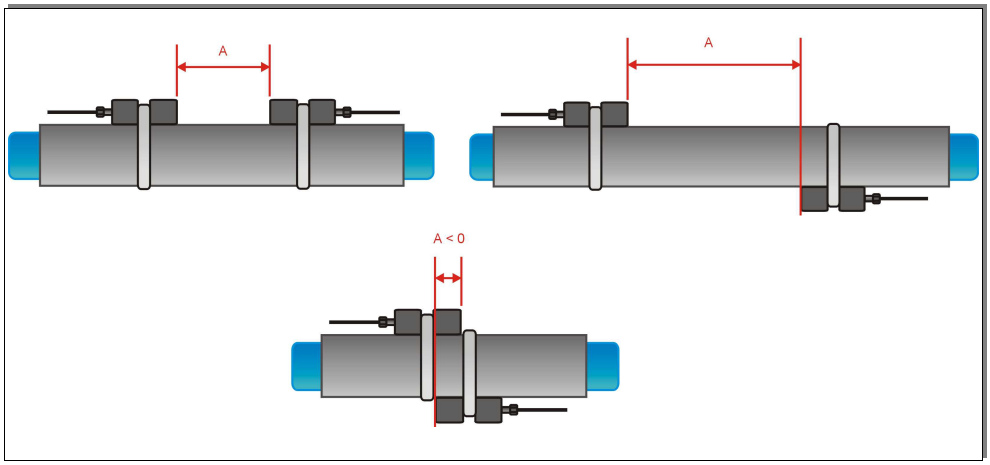


Illustration 4: Sensor pipe mounting configurations

3.7.2 Acoustic coupling gel

In order to obtain acoustical contact between the pipe and the sensors, apply a bead of acoustic coupling gel lengthwise down the centre of the contact area of the sensors.

Illustration 5: Application of acoustic coupling gel

3.7.3 Correct positioning of the sensors

Correct sensor position

Illustration 6: Correct positioning of the sensors

Always mount the transducer pair so that the free front edges of the sensors face each other.

There is a different engraving on the top of each transducer. The transducers are mounted correctly if the engravings on the two transducers form an arrow. The transducer cables should point in opposite directions.

Later, the arrow, in conjunction with the indicated measured value, will help to determine the direction of flow.

The sensor separation distance is automatically calculated by the flowmeter based on the parameter entries for pipe outside diameter, wall thickness, lining material and thickness, medium, process temperature, the sensor type and the selected number of signal passes. The sensor positioning screen (above, and Section 3.3) allows fine adjustment of the sensor location.

3.7.4 Sensor mounting with fixtures and chains

Illustration 7: Sensor mounting with clips and chains

- Insert the retaining clip into the groove on the top of the transducer and secure it using the screw knob.
- Apply some acoustic coupling component to the contact surface of the transducer.

- Place the transducer on the side of the pipe or alternatively up to 45 degrees from the horizontal plane through the pipe.
  This is advisable to establish the best acoustic contact since on top of the pipe air pockets could develop and deposits could accumulate at the bottom of the pipe.
- Take the spring end of the chain in one hand and insert the last ball element in the vertical slot of the retaining clip. Mount the chain around the pipe.
- Pull the chain firmly around the pipe and fasten it in the lateral slot of the retaining clip. There should be no air pockets between the transducer surface and the pipe wall.
- Mount the second transducer the same way.
- Using a measuring tape, adjust the sensor separation distance as suggested by the flowmeter. When the sensor positioning screen (Section 3.3) is displayed, the middle bar allows fine adjustment of the sensor location.

Illustration 8: Sensor mounting with fixtures and chains (retaining clip)

4 Operation

4.1 Switching On/Off

The flowmeter is switched on by holding the **<ON>** key for more than 2 seconds continuously. Equally it can be switched off by pressing the **<OFF>** key for more than 2 seconds.

When switching on, the flowmeter will perform a hardware and software check, including the data logger space. Progress will be indicated by a series of dashes above and a black bar below.

4.2 Battery charging

The internal batteries can be recharged with the external battery charger supplied.

Important : Ensure that only Nickel Metal Hydride (NiMH) AA size rechargeable batteries are installed – attempting to recharge other battery types is dangerous and may cause damage.

Connect the battery charger to the charging socket of the flowmeter and to the mains supply 100 ... 240 VAC, 50/60 Hz. The battery charger mains plug is supplied for specific countries as shown in the order code.

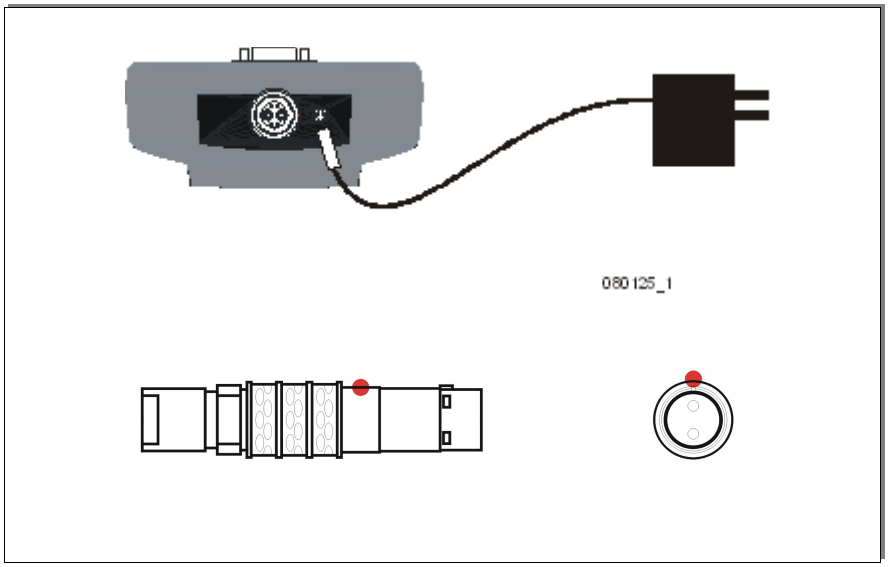

Illustration 9: Battery charging

The red mark on the plug aligns with the mark on the socket. Remove plug by sliding the outer casing away from the socket to release the latch.

During the charging process, the battery icon will blink. For a fully charged battery all segments of the battery icon will be filled.

4.3 Keypad and display

Illustration 10: Keypad and display overview

Keypad key functions

Key	Main function	Secondary function
	Character entry: **1** (1 short key stroke) **,** (2 short key strokes) **.** (3 short key strokes) **_** (4 short key strokes)	Show **NEXT** available item

4.3.1 Display functions

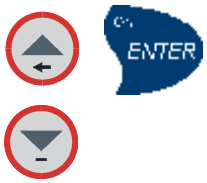
Display icon	Function

	On	Not used on KF200
	Off	
	On	Speaker on
	Off	Speaker off
	On	Coupling error
	Off	Sensor operating correctly
	On	Icon not used
	Off	
	On	Icon not used
	Off	
	On	Time/date set
	Off	Clock error
	On	Error recorded in error log
	Off	No error detected
	On	Serial output RS 232 switched on
	Off	Serial output RS 232 switched off
"L", "LT" or "T"	Displays whether flow is laminar, turbulent or mixed	

4.4 Quick setup wizard

The quick setup wizard allows for a speedy setup of the most important parameters in order to achieve successful measurements in the shortest possible time:

Display screen	Operation



MAIN MENU Quick start Installation Output System	The main menu is displayed after first power on and the boot-up sequence. Use <**UP**> and <**DOWN**> cursor keys to select **Quick start**. Confirm by pressing <**ENTER**>.
QUICK START Setup Wizard Stored Setup Start Measurement	Use cursor keys to select **Setup Wizard**. Confirm by pressing <**ENTER**>. If sensors are recognised, the serial number will be shown. If not recognised or not connected, they may be selected from a list.
MIDDLE UNITS m3/h m3/m m3/s	Select units of measurement using cursor keys and pressing <**ENTER**>.
PIPE MATERIAL Stainless Steel Carbon Steel Ductile cast iron	Choose pipe material using cursor keys and pressing <**ENTER**>.
OUTSIDE DIAMETER 76.1 mm	Enter outside pipe diameter using alphanumerical keys and confirm by pressing <**ENTER**>. Use key <**UP**> as character backspace clear to correct for data entry errors.
WALL THICKNESS 3.4 mm	Enter pipe wall thickness using alphanumerical keys and confirm by pressing <**ENTER**>. Use key <**UP**> as character backspace clear to correct for data entry errors.
FLUID Water Saltwater Acetone	Select fluid using cursor keys. Confirm by pressing <**ENTER**>.

	Enter process temperature using alphanumerical keys and confirm by pressing <**ENTER**>. Use key <**UP**> as character backspace clear to correct for data entry errors.
	Select pipe lining material using cursor keys. Confirm by pressing <**ENTER**>.
	Select transducer configuration (number of passes) using cursor keys. **Auto** Automatically **1** 1 pass, diagonal mode **2** 2 passes, reflection mode **3** 3 passes, diagonal mode **4** 4 passes, reflection mode **5** 5 passes, diagonal mode **6** 6 passes, reflection mode ..etc. Confirm by pressing <**ENTER**>.
	Use cursor keys to select **Start Measurement**. Confirm by pressing <**ENTER**>.
	Sensor placement screen: Mount transducers with suggested spacing and use middle bar for fine adjustment of position (central position is desired). Observe signal-to-noise (upper bar) and quality (lower bar). These should be of identical length. Confirm by pressing <**ENTER**> to obtain measurements. **Note : Numbers shown are for indication only.**
	**Success!**

4.5 Measurements

4.5.1 Main process value (PV) display

Measurements are started using **Start Measurement** in the Quick Start Wizard.

Display screen	Operation
FLOW RATE 25.678 m3/h 11/11/07 10:56:00	The main process value can be changed in the "Quick Start" or "Installation" menus. Press **<ESC>** at any time to return to the main menu. View totalizers by pressing **<NEXT>**. Change to the Diagnostic display by pressing **<DISP>**.

3-line display format

Display screen	Operation
CHNL-1 - 0.0 m3 25.678 m3/h 1.370 m/s 11/11/07 10:56:00	The three-line display screen is configureable to show flow, totalizers and diagnostic functions. Change to diagnostic displays by pressing **<DISP>** and to totalizer screens by pressing **<NEXT>.** Cycle through display screens using **<NEXT>.**

4.5.2 Diagnostic displays

Display screen	Operation
DIAGNOSTIC 1 55.2 Gain 20.5 Signal -10.0 Noise 11/11/07 10:56:00	Line 1 shows the amplifier gain. Line 2 displays the signal strength. Line 3 indicates the noise. Change to more diagnostic displays by pressing **<NEXT>**. Refer to Customer Support for the meanings of each diagnostic screen

4.5.3 Totalisers

The totaliser displays will only be shown when the totalisers are activated.

Display screen	Operation

TOTALISER -1 - 0.0 m3 **0.0** + - 0.0 - 11/11/07 10:56:00	The flow totaliser can be started or reset by pressing **<Q_{ON}>** when a volume measurement is selected as one of the displayed units. Totalizer screens are viewed by pressing **<NEXT>** from the measurement screen. When top and bottom display lines are set to a volume measurement, the first totalizer screen displays cumulative totals and the second screen shows separate positive and negative totals. Pressing **<NEXT>** again will return to the main measurement screen. Pressing **<Q_{+}>** resets the total accumulated flow in the positive flow direction. Pressing **<Q->** resets the total accumulated flow in the negative flow direction. The totalisers can be stopped by pressing **<Q_{OFF}>**. Pressing **<Q_{ON}>** again will reset to zero. Change to other displays or revert to the totalizer screen without resetting by pressing **<DISP>** or **<NEXT>**.

4.5.4 Datalogger

The datalogger is enabled from the Main Menu, and operates when a non-zero value is entered for the interval.
Items to be logged are selected from the “Selection” screen. “ENTER” selects items, “0” deselects. Up to ten items may be selected.
(Note : If no items are selected the logger will record blank space)
Send logger by serial port to a terminal program by selecting “Log download”.
Clear the logger by selecting “Log Erase”.

Logged data can be downloaded, viewed and exported using the KatData+ software except when "wrap" mode has been enabled.

5 Commissioning

			Shows measured temperature, available logger memory, battery charge level, battery voltage (Cycle using **<ENTER>**)
Scope			
			Displays the received acoustic pulse (see 5.7)

5.2 Diagnostics

Diagnostic screens can be viewed directly during measurement or through the menu structure.

5.3 Display settings

Customer specific settings for data to be displayed can be achieved by using the appropriate menu items.

5.3.1 Main PV

The main Process Value (PV) is the primary measurement data.

5.4 Output settings

5.4.1 Serial interface RS 232

The RS 232 serial interface can be used to transmit data on-line or to download the integral datalogger content. The settings can be found in the **Serial Communication** submenu .

5.5 KATdata software

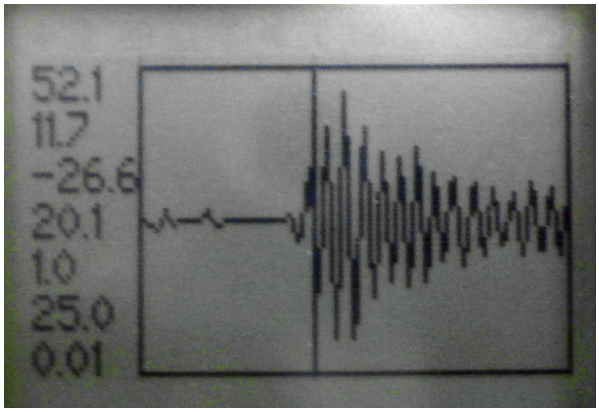
Software can be provided for downloading the contents of the datalogger and communication with the flowmeter.

5.6 Wall thickness measurement (WTM)

Optional sensor probes to measure pipe wall thickness are available. Use the Wizard or Installation menu to set the pipe material. Connect to the sensor input and select “Start Measurement”. The KF200 will recognise the probe and display the measurement screen. Wall thickness will be shown when the sensor is in good acoustic contact with the pipe.

5.7 Scope function

Katronic flowmeters have an additional scope function which shows a representation of the pulse received by the sensors.



In addition to displaying the received pulse, this screen lists the following data (from top to bottom) :

Gain (dB)
Signal (dB)
Noise (dB)
Transit time (us)
Delta (ns) - [time downstream minus time upstream]
Control unit temperature (degC)
Flow (m/s)

6 Maintenance

KATflow flowmeters are maintenance free concerning the flow measurement functions. Within the scope of periodic inspections, regular inspection for signs of damage or corrosion is recommended for the transducers, the junction box if installed, and the flowmeter housing.

6.1 Service/Repair

KATflow flowmeters have been carefully manufactured and tested. If installed and operated in accordance with the operating instructions, no problems are usually experienced.

Should you nevertheless need to return a device for inspection or repair, please pay attention to the following points:

- Due to statutory regulations on environmental protection and safeguarding the health and safety of our personnel, the manufacturer may only handle, test and repair returned devices that have been in contact with products without risk to personnel and environment.
- This means that the manufacturer can only service this device if it is accompanied by a Customer Return Note (CRN) confirming that the device is safe to handle.

If the device has been operated with toxic, caustic, flammable or water-endangering products, you are kindly requested:

- to check and ensure, if necessary by rinsing or neutralising, that all cavities are free from such dangerous substances,
- to enclose a certificate with the device confirming that is safe to handle and stating the product used.

7 Troubleshooting

Most problems with measurement are due to poor signal strength or quality. Initial checks should include :

- Has sufficient acoustic coupling paste been applied?
- Can the number of sound passes be changed? As a general rule, more passes will improve accuracy, fewer passes will give better signal strength.
- Are there any nearby sources of noise or disturbance?
- Can the signal be improved by moving the sensors around the circumference of the pipe?
- Are the application parameters correct?

Should there be the need to call customer service, please let us know the following details:

- Model code
- Serial number
- SW, HW revision
- Error log list

Possible error messages may include the following:

Error list

Error message	Group	Description	Error handling
USB INIT FAIL	Hardware	Internal board communication error	Power on/off, otherwise call customer support
NO SERIAL NO.	Hardware	Failed to read from FRAM	Call customer support
NO VERSION NO.	Hardware	Failed to read from FRAM	Call customer support

Table 3: Error messages

7.1 Data download difficulties

If difficulties are encountered downloading the logger data : -

- Check that the flowmeter is switched on and not in measurement mode.
- Check that the same number COM port is allocated in the “Device Manager” (or equivalent) as is set in the KatData+ software.
- Check that the settings (baud, parity, word length, stop bits) are identical.
- Use the supplied connectors – whether connecting to a 9-pin COM port or converting from serial communication to a Universal Serial Bus (USB).
- Is the logger in "Wrap" mode? If "yes", use a terminal program and the "Log download" command. If "No", KatData+ software may also be used.

8 Technical data

	Sound Speed* Shear Wave (at 25 ºC)	
Material	**m/s**	**ft/s**
Steel, 1% Carbon, hardened	3,150	10,335

9 Specification

General

Measuring principle : Ultrasonic time difference correlation principle
Flow velocity range : 0.01 ... 25 m/s
Resolution : 0.25 mm/s
Repeatibility : 0.15 % of measured value ± 0.015 m/s
Accuracy : *Volume flow*
± 1 ... 3 % of measured value depending on application,
± 0.5 % of measured value with process calibration
Flow velocity
± 0.5 % of measured value
Turn down ratio : 1/100
Gaseous and solid content of liquid media : < 10 % of volume

Flowmeter

Enclosure : Hand-held
Degree of protection : IP 65 according EN 60529
Operating temperature : -10 ... 60 °C (14 ... 140 °F)
Housing material : ABS (UL 94 HB)
Flow channels : 1
Power supply : Internal rechargeable batteries 4 x NiMH AA 2850 mAh
(daily discharge rate approx. 2% per day, operating range 0-30 deg C)
or external power supply 9 V DC
Operating time : > 24 h with fully charged batteries
Display : LCD graphic display, 128 x 64 dots, backlit
Dimensions : H 228 x W 72/117 x D 47 mm
Weight : Approx. 650 g
Power consumption : < 10 W
Signal damping : 0 ... 99 s
Measurement rate : 1Hz standard, higher rates on application
Operating languages : English, German, French, Spanish, Russian
Response time : 1 s

Quantity and units of measurement

Volumetric flow rate : m3/h, m3/min, m3/s, l/h, l/min, l/s, USgal/h (US gallons per hour), USgal/min, USgal/s, bbl/d (barrels per day), bbl/h, bbl/min, bbl/s
Flow velocity : m/s, ft/s, inch/s
Mass flow rate : g/s, t/h, kg/h, kg/min
Volume : m^3, l, gal (US gallons), bbl
Mass : g, kg, t

Internal data logger

Storage capacity : In excess of 1 million data points (16MB)
Logging data : Up to ten selected variables

Communication
Serial interface : RS 232
Data : Instantaneous measured value,
parameter set and configuration,
logged data

KATdata+ Software

Functionality : Downloading of measured values/parameter sets, graphical presentation, list format, export to third party software, on-line transfer of measured data
Operating systems : Windows 2000, NT, XP, Vista, 7; Linux; Mac (optional)

Declaration of Conformity

We, Katronic Technologies Ltd., declare under our sole responsibility that the products listed below to which this declaration relates are in conformity with the EEC directives:

EMC Directive 2004/108/EC for Electromagnetic Compatibility
Low Voltage Directive 2006/95/EC for Electrical Safety

Description of products:

Ultrasonic flowmeters KATflow 100, 150, 170, 200 and 230 with associated KATRONIC transducers

The mentioned products are in conformity with the following European Standards:

Class	Standard	Description
EMC Directive	*BS EN 61326-1:2006*	*Electrical equipment for measurement, control and laboratory use - EMC requirements*
Immunity	*BS EN 61326-1:2006*	*Electrical equipment for continuous unattended use*
	BS EN 61000-4-2:1995	*Electrostatic discharge*
	BS EN 61000-4-3:2006	*RF field*
	BS EN 61000-4-4:2004	*Electric fast transient/burst*
	BS EN 61000-4-5:2006	*Surge*
	BS EN 61000-4-6:2009	*RF conducted*
	BS EN 61000-4-11:2004	*AC mains voltage dips and interruption*
Emission	*BS EN 61326-1:2006*	*Electrical equipment Class B*
	BS EN 55022:2010	*Disturbance voltage Class B*
Low Voltage Directive	*BS EN 61010-1:2010*	*Safety requirements for electrical equipment for measurement, control and laboratory use*

Coventry, 31 August 2012

Customer Return Note (CRN)

Company		*Address*	
Name			
Tel. No.			
E-mail			

Instrument model		*Katronic contract no. (if known)*	
Serial number			
Sensor type(s)			
Sensor serial number(s)			

The enclosed instrument has been used in the following environment (please √):

Nuclear radiation	
Water-endangering	
Toxic	
Caustic	
Biological	
Other (please specify)	

We confirm (delete if not applicable)*

- *that we have checked the instrument and sensors are free of any contamination*,*
- *neutralised, flushed and decontaminated all parts which have been in contact with hazardous substances and/or environments*,*
- *that there is no risk to man or environment through any residual material.*
